

True friends or false friends?

Lexical similarity for predicting cross-signing success

Carl (Calle) Börstell
Onno Crasborn
Lori Whynot

Radboud University
Nijmegen, the Netherlands

Communication across languages

- Two people meet.
They don't know each other.
They don't have a shared language.

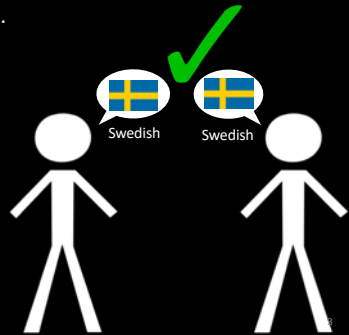

How do they communicate?

Communication across languages

- If they *do* speak the same language...

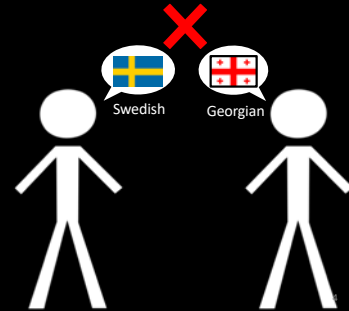

No problem!

Communication across languages

- If they speak the different languages...

Problematic!

Communication across languages

- If they speak the *similar* languages...

It depends!

True friends & false friends

- Some word forms are similar across languages...

- If they mean the *same* thing...

= TRUE FRIENDS!

teckenspråk
'sign language'

tegnspråk
'sign language'

- If they mean *different* things...

= FALSE FRIENDS

rolig
'funny'

rolig
'calm'

We can communicate across some languages,
like Swedish and Norwegian

... but what about sign languages?

Cross-signing

- Previous research points to communication across different languages being possible – *cross-signing*

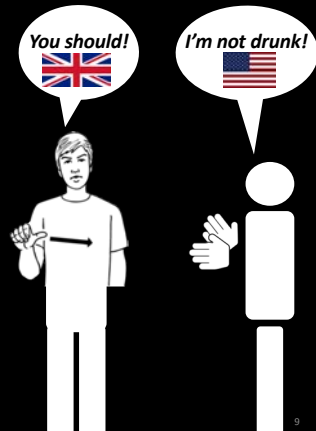

... even when the two sign languages are unrelated!

Supalla & Webb 1995; Zeshan 2015; Byun et al. 2018; *inter alia*

True or false friends?

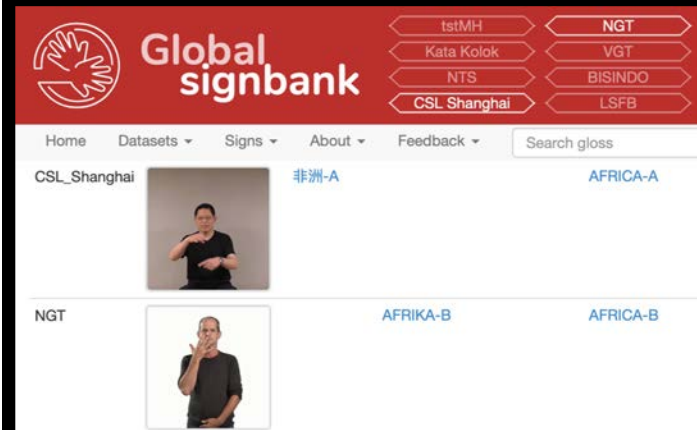

- If you see a sign from another SL:
 - You know the sign
 - L2 knowledge
 - The meaning is the **same** in your SL
 - True friend
 - The meaning is **different** in your SL
 - False friend

McKee et al. 2019

Can we use **true/false** friends to measure linguistic distance?

... If so, does it predict cross-signing success between those languages?

Global signbank

NGT

CSL

	No of hands	Handshape	Location	Mov. direction	Repeated mov.	TOTAL
NGT	1	B	Neutral	Ipsilateral		
CSL	1	B	Neutral	Ipsilateral		
Similarity	1	1	1	1		

Example: Comparing signs for 'no'

NGT

CSL

	No of hands	Handshape	Location	Mov. direction	Repeated mov.	TOTAL
NGT	1	B	Neutral	Ipsilateral	No	
CSL	1	B	Neutral	Ipsilateral	Yes	
Similarity	1	1	1	1	0	

Example: Comparing signs for 'no'

NGT

CSL

	No of hands	Handshape	Location	Mov. direction	Repeated mov.	TOTAL
NGT	1	B	Neutral	Ipsilateral	No	
CSL	1	B	Neutral	Ipsilateral	Yes	
Similarity	1	1	1	1	0	4/5 = 0.8

Phonological properties in Signbank

- Handedness
- Strong Hand
- Weak Hand
- Handshape Change
- Relation between Articulators
- Location
- Relative Orientation: Movement
- Relative Orientation: Location
- Orientation Change
- Contact Type
- Movement Shape
- Movement Direction
- Repeated Movement
- Alternating Movement

19

Languages in Global Signbank

- Sign Language of the Netherlands (NGT)
 - 3,531 coded signs
- Shanghai Chinese Sign Language (CSL)
 - 568 coded signs
- International Sign (IS)
 - 200 coded signs

20

Finding our friends

A short Python script →

1. Compare all FORMS
– every sign in both datasets
2. Compare matched MEANINGS
– only meaning-matched signs

```

import csv, sys, operator
from collections import defaultdict
from datetime import date
import numpy as np
from itertools import combinations

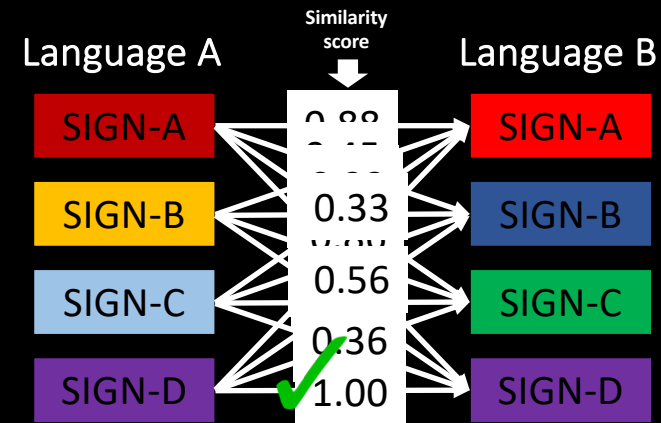

class Sign:
    """Class for each instance of a sign entry in Signbank"""
    def __init__(self, signbank, concept_id, id, gloss, signbank_data, language, phonology):
        self.signbank = signbank
        self.concept_id = concept_id
        self.gloss = gloss
        self.signbank_data = signbank_data
        self.id = id
        self.language = language
        self.phonology = phonology

    """Method of the Sign class that compares a sign to another arbitrary sign by going through
    the phonological features of each sign and returning the mean score of identical values
    for those features that are relevant to each sign"""
    def compare(self, sign2):
        try:
            paired = signbank.phonology.sign.phonology
            identifier = self.phonology for B in paired if not B[0] in ["N", "N", "N", "N", "N"]
            return B[1]
        except:
            print("Error")

class Language:
    """Class for each language in Signbank (e.g. a dataset)"""
    def __init__(self, language, concept_id):
        self.language = language
        self.concept_id = concept_id

    """Compares a language object to another arbitrary language (dataset) to see required data"""
    def compare_language(self, language2):
        best_matches = defaultdict(list)
        for a in self.concepts:
            for b in language2.concepts:
                for sign in self.signbank:
                    for sign2 in language2.signbank:
                        best_matches[a.concept_id].append(sign.compare(sign2))
        return best_matches

```

Comparing signs, part 1

From FORM to MEANING

Finding our friends

- Comparing NGT and Shanghai CSL

- Script gives us 30 *sign pairs* that have identical forms in both languages

- A manual check proves that
 - 12 pairs are **true** friends
 - 18 are **false** friends

Finding our friends

- Comparing NGT and IS
- Script gives us 10 *sign pairs* that have identical forms in both languages
- A manual check proves that
 - 6 pairs are **true** friends
 - 4 are **false** friends

ZERO

ZERO

✓

TUESDAY

ONE

✗

25

Finding our friends

- Comparing CSL and IS
- Script gives us 0 *sign pairs* that have identical forms in both languages
- But the two datasets are small (568 signs ~ 200 signs)

?

26

Interim findings: **true/false** friends

- Our method helps us identify true/false friends across languages of Global Signbank semi-automatically
- The number of friends found depends on size of datasets (languages)
- Are NGT~IS closer than NGT~CSL? Too little data!

27 

Comparing signs, part 2

From MEANING to FORM

28

Lexical similarity

- Linking specific CONCEPTS, we can measure how similar two languages are
- A script automatically matches *sign glosses* to the 3,431 *concepts* in the Concepticon database:

1. CONTEMPTIBLE
2. DUST
3. BRAVE
4. COURTYARD
5. GAZELLE
- ...

List et al. 2019

29

Lexical similarity script

30

Lexicostatistics

Previous methods

- Only basic form parameters:
 - Handshape
 - Location
 - Movement
 - Orientation
- 3/4 or 2/3 counts as "similar"

Our methods

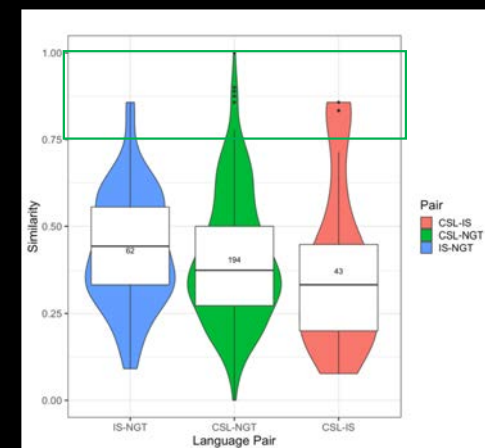

- Looks at more detailed phonological properties
- Automatically with a computer; uniform database
- Gives a more precise score (0–1)

Woodward 1991, 1993, 2000; Bickford 2005;
Al-Fityani & Padden 2010; *inter alia*

31

Lexical similarity

- Very few signs are **true friends** or **near friends**

32

Lexical similarity: matches

- Looking at the top form-similar matched concepts, we find
 - Numbers*: ZERO, ONE, TWO, ...
 - Body-parts*: FACE, ARM, EAR
 - Gestures(?)*: GOOD, NO, MONEY
- We need more data!

CONCEPT	Pair	Score
GOOD	CSL-NGT	1.00
HAPPY	CSL-NGT	0.90
ELECTRICITY	CSL-NGT	0.89
NO	CSL-NGT	0.88
GOOD	IS-NGT	0.86
FACE	CSL-NGT	0.86
GOOD	CSL-IS	0.86
MONEY	IS-NGT	0.83
ONE	CSL-IS	0.83
FOUR	CSL-IS	0.83
ZERO	CSL-IS	0.83
TWO	CSL-IS	0.83
COLD	CSL-NGT	0.78
ARM	CSL-NGT	0.78
EAR	CSL-NGT	0.75
WHAT	CSL-NGT	0.75

Conclusions

- A two-part method for comparing **lexical similarity** across languages of Global Signbank
- Both methods suggest that CSL is more **distinct** from NGT and IS
 - Supports recent cross-linguistic work on phonology of Western vs. Eastern SLs – but our datasets are still small
- We will use these metrics in our research on **communicative success** in cross-signing

Yu et al. 2018

THANK YOU!

This study was funded by the *Netherlands Organisation for Scientific Research (NWO)* grant number 277-70-014.

We would like to acknowledge the rest of our team, Tashi Bradford, Aurélia Nana Gassa Gongga, Maya de Wit, and Merel van Zuilen. A special thanks to Anique Schüller and Neil Ray for annotating specific Signbank data for this study.
